Subject: Application for Verification Engineering Intern - Russell Tabata

Dear Hiring team

My name is Russell Tabata, I am a computer engineering student at University of Toronto specializing in low level development and processor design. I am writing to express my extremely enthusiastic interest in fulfilling the role of verification engineering intern at ARM. Even outside of the professional space I have always been fascinated by both the ARM architecture, a highly power efficient RISC architecture that powers the mobile computing world, and even extensively looked into the history of the company, such as your roots as the Acorn RISC Machine and the infamous story of the very first ARM processor working off leakage current from I/O lines even with no power to its supply lines. That is one of my favourite stories in tech.

Outside of my classes I work on personal projects that get me as low in the computing stack as possible as I find it exceedingly fascinating. I built a fully functioning 16-bit RISC processor recently based off the HACK ISA to teach myself processor design and architecture. I have also built hardware accelerators such as a systolic array accelerator for high-speed vector calculations. Outside of personal projects I am also an executive member of the Open Source society team at UofT where I work with a team of students to develop a multi-cycle 32-bit RISC-V processor. I know how to make actionable change with a team and deliver on an end product. With these experiences I am highly familiar with RTL, verification, and fundamental computer architecture concepts. Additionally, on the high-level end of programming I am highly proficient with python, having my specialization certification from the university of Michigan, as well as building many AI-centric applications such as an assistive headset for blind individuals that used a monocular depth estimation model to warn users of oncoming obstructions. You can find information on all these projects and more in my Github and Hackaday links in my resume.

If I were to work absolutely anywhere to apply my skills in processor development and verification I would do so at ARM, the company that is at the forefront of portable computing processing. This may sound overly eager but the reality is that the ARM story is one of the reasons why I love processor development and why I find it so fascinating.

Thank you for considering my application. I have attached my resume for your review and welcome the opportunity to discuss how my skills and ambition align with the goals of the verification team at ARM.

Sincerely,
Russell Tabata
